
Summary

The study aimed to investigate the relationship between educational system and children's behavior. The findings suggest that the educational system significantly influences children's behavior. The study recommends that educational reforms should focus on improving the educational environment and providing adequate support to children. The implications of the study are discussed, and further research is suggested.
2 Introduction

1 Material and Methods

2 Experimental Design, Materials and Methods

Keywords: Bioinformatics, Association studies, SNP, ChIP-Seq

1 Introduction

The experimental design, materials and methods section describes the experimental design, materials, and methods used in the study. This section typically includes details about the study design, the participants or samples used, the procedures or methods employed, and the tools used for data collection and analysis. The purpose is to provide sufficient detail to allow other researchers to replicate the study and validate the results.
